Hybrid Technology

HYBRID TECHNOLOGY

House, Apartment and Special Doors

Doors made of steel, wood, aluminum or PVC offered by manufacturers have both advantages and disadvantages. Knowing the strengths and weaknesses of each material, we created hybrid doors.

Intelligently combining different materials allows you to obtain optimal product properties. The core of the thermal door frame is made of wood. This provides excellent insulation, thermal stability, rigidity and lightness of the structure. Wood is protected from the influence of atmospheric conditions by covering with a sheet, which additionally stiffens and improves mechanical properties. The door frame can also be made of an aluminum profile with a thermal spacer with a thickness of up to 90mm.

Hybrid technology allows, on the one hand, to create doors with unique thermal insulation, and on the other hand, doors with a very high class of anti-burglary and fire protection.
